IN THE CLAIMS:

Please amend Claims 1 and 10, and add new Claim 14, as shown below.

- 1. (Currently Amended) A photovoltaic cell comprising:
- a photovoltaic element; and
- a coating film provided on the photovoltaic element,
- wherein the photovoltaic element has an electrode portion having a thickness larger than the average thickness of the coating film, and
- a thickness of a part of the coating film which is in contact with the electrode portion is equal to or smaller than the average thickness of the coating film.
- (Original) The photovoltaic cell according to Claim 1, wherein the coating film comprises a thermosetting coating material, and the thermosetting coating material before curing has a viscosity in the range of from 1 to 50 mPa s.
- (Original) The photovoltaic cell according to Claim 1, wherein the average thickness of the coating film is 0.5 mm or less.
- (Original) The photovoltaic cell according to Claim 1, wherein the coating film comprises a coating material containing at least an acrylic resin.
 - 5. (Original) The photovoltaic cell according to Claim 1, wherein the

coating film comprises a coating material, and the electrode portion comprises an insulating member and a conductive foil body.

- (Original) The photovoltaic cell according to Claim 5, wherein the insulating member comprises an acrylic adhesive layer.
- 7. (Original) The photovoltaic cell according to Claim 5, wherein a part of the insulating member located at a position higher than the average thickness of the coating film has a low wettability to the coating material.
- 8. (Original) The photovoltaic cell according to Claim 7, wherein a side surface of the insulating member comprises an agent causing the side surface of the insulating member to have a low wettability to the coating material, the side surface of the insulating member being located at a side of the electrode portion which is in contact with the coating film.
- (Original) The photovoltaic cell according to Claim 8, wherein the insulating member includes a base plate comprising the agent.
- 10. (Currently Amended) A method for manufacturing a photovoltaic cell having a photovoltaic element and a coating film provided on the photovoltaic element, comprising:

- a step of forming the coating film on a light receiving face of the
- a step of heating the coating film for curing while a part thereof in contact with an electrode portion of the photovoltaic element is being maintained such that it has a thickness equal to or smaller than the average thickness of the coating film.
- 11. (Original) The method for manufacturing a photovoltaic cell according to Claim 10, further comprising a step of coating a side surface of an insulating member of the electrode portion with an agent which causes the side surface of the insulating member to have a low wettability to a coating material contained in the coating film, wherein the side surface of the insulating member is located at a side of the electrode portion which is brought into contact with the coating film.
- 12. (Original) The method for manufacturing a photovoltaic cell according to Claim 11, wherein the agent is a release agent contained in a mixed solution at a concentration of 0.1 to 30 percent.
- 13. (Original) The method for manufacturing a photovoltaic cell according to Claim 10, further comprising a step of forming an insulating member of the electrode portion by slitting a tape comprising a base plate, wherein the base plate and a side surface of the insulating member comprise an agent which causes the side surface of the insulating member to have a low wettability to a coating material contained in the coating film, and

wherein the side surface of the insulating member is located at a side of the electrode portion which is brought into contact with the coating film.

- 14. (New) A photovoltaic cell comprising:
- a photovoltaic element; and
- a coating film provided on the photovoltaic element,
- wherein the photovoltaic element has an electrode portion having a thickness larger than the average thickness of the coating film,
- a thickness of a part of the coating film which is in contact with the electrode portion is equal to or smaller than the average thickness of the coating film,
- $\label{eq:continuous} \mbox{the electrode portion is provided outside of a power generation region of the}$ photovoltaic element,
- $\label{eq:controller} \mbox{the photovoltaic element has collector electrodes on the power generation}$ region, and
- the coating film covers the power generation region and the collector electrodes.
